Dincel Construction System Pty Ltd
Level 3
7K Parkes Street
PARRAMATTA NSW 2150

Dear Burak

RE: COCHLEAR BUILDING – MACQUARIE UNIVERSITY, RYDE, SYDNEY

The Dincel Construction System has been utilised on this project for a range of retaining walls, two levels of basement walls.

Basement walls of this project consisted 140m long walls. These walls were installed without the need of waterproof membranes, scaffolding, horizontal wall reinforcement and joints in a very short space of time. The product improves the site logistics and housekeeping, reduces the potential risk of injuries and its speed and ease of installation are major advantages. Dincel-Walls lends itself to be installed with minimum skill and training level.

We have found the product to be cost-effective, versatile, practical and fit for its intended purpose.

We would not hesitate to encourage the use of the product on future projects and in future will promote the product to Structural Designers and Architects when the need arises, as we have been able to realise several direct benefits as a result in utilising the product to date.

Due to the advantages of utilising the Dincel product on this project, we would recommend that the product be adopted for use on other Watpac projects. We would welcome the opportunity to work with this highly innovative product again.

Yours faithfully
Watpac Construction (NSW)

MICHAEL KOUKNAS
Project Manager
